

Turtle Race!

Introduction

In this project you will use loops to create a racing turtle game and draw a race track.

Step 1: Race track

You're going to create a game with racing turtles. First they'll need a race track.

Activity Checklist

- ☐ Open the blank Python template Trinket: jump.to/cc/python-new (<http://jump.to/cc/python-new>).
- ☐ Add the following code to draw a line using the 'turtle':

```
from turtle import *  
forward(100)
```

☐ Now let's use the turtle to draw some track markings for the race.

The turtle `write` function writes text to the screen.

Try it:

```
from turtle import *  
write(0)  
forward(100)  
write(5)
```

☐ Now you need to fill in the numbers in between to create markings:

```
write(0)  
forward(20)  
write(1)  
forward(20)  
write(2)  
forward(20)  
write(3)  
forward(20)  
write(4)  
forward(20)  
write(5)  
forward(20)
```

☐ Did you notice that your code is very repetitive? The only thing that changes is the number to write.

There's a better way of doing this in Python. You can use a `for` loop.

Update your code to use a `for` loop:

```
from turtle import *
```

```
for step in range(5):  
    write(step)  
    forward(20)
```

- Hmm, that only prints numbers up to 4. In Python `range(5)` returns five numbers, from 0 up to 4. To get it to also return 5 you'll need to use `range(6)`:

```
for step in range(6):  
    write(step)  
    forward(20)
```

- Now we can draw some track markings. The turtle starts at coordinates (0,0) in the middle of the screen.

Move the turtle to the top left instead:

```
from turtle import *
```

```
goto(-140, 140)
```

```
for step in range(6):  
    write(step)  
    forward(20)
```

- Ah, you'll want to lift the pen up first!

```
penup()  
goto(-140, 140)
```

```
for step in range(6):  
    write(step)  
    forward(20)
```

- Instead of drawing a line horizontally, let's draw vertical lines to create a

track:

```
for step in range(6):  
    write(step)  
    right(90)  
    forward(10)  
    pendown()  
    forward(150)  
    penup()  
    backward(160)  
    left(90)  
    forward(20)
```

`right(90)` makes the turtle turn right 90 degrees (a right angle.) Moving `forward(10)` before putting the pen down leaves a small gap between the number and the start of the line. After drawing the line you lift up the pen and go `backward(160)` the length of the line plus the gap.

☐ It looks neater if you centre the numbers:

```
for step in range(6):  
    write(step, align='center')  
    right(90)  
    forward(10)  
    pendown()  
    forward(150)  
    penup()  
    backward(160)  
    left(90)  
    forward(20)
```

☐ And you can speed up the turtle so it draws faster:

```
from turtle import *  
  
speed(10)  
penup()  
goto(-140, 140)
```

Challenge: More lines

Can you change your code so that the track lines go right across the screen?

If you want to make the turtle go even faster you can use `speed(0)`.

Step 2: Racing turtles

Now for the fun bit. Let's add some racing turtles. It would be really boring if the turtles did the same thing every time so they will move a random number of steps each turn. The winner is the turtle that gets the furthest in 100 turns.

Activity Checklist

- ☐ When you use commands like `forward(20)` you are using a single turtle. But you can create more turtles. Add the following code to the end of your script (but make sure it's not indented):

The first line creates a turtle called 'ada'. The next lines set the colour and shape of the turtle. Now it really looks like a turtle!

☐ Let's send the turtle to the starting line:

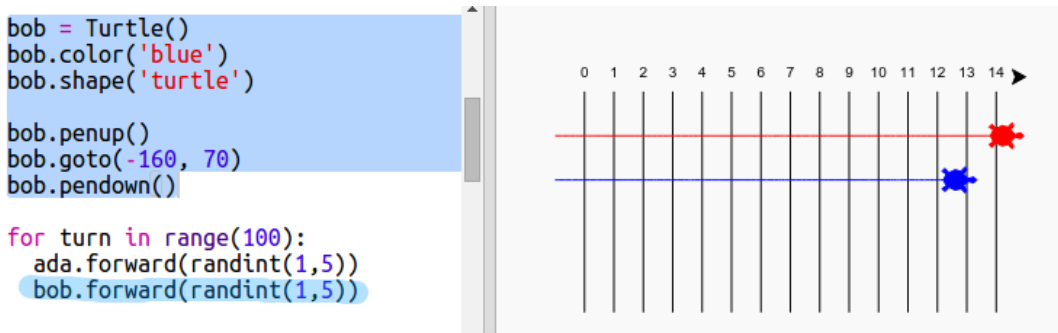

☐ Now you need to make the turtle race by moving a random number of steps at a time. You'll need the `randint` function from the Python `random` library. Add this `import` line to the top of your script:

```
from turtle import *
from random import randint
```

☐ The `randint` function returns a random integer (whole number) between the values chosen. The turtle will move forward 1, 2, 3, 4, or 5 steps at each turn.

☐ One turtle isn't much of a race! Let's add another one:

Note that the code for moving the blue turtle needs to be in **the same** `for` loop as the code for moving the red turtle so that they each make a move every turn.

Challenge: Race time!

Now you're ready to race. Pick a turtle and an opponent and see who wins.

Can you add more turtles so you can race with more friends?

Colours include: orange, purple, violet, tomato, turquoise, magenta and brown - or you can go to jump.to/cc/colours (<http://jump.to/cc/colours>) and pick any colour you like!

Save Your Project

Challenge: Do a twirl

Can you use a `for turn in range():` loop to make each turtle do a 360 degree twirl after they get to the starting line? You'll need to make sure they are facing in the right direction at the start of the race!

`ada.right(36)` will turn the red turtle right by 36 degrees.

Hint: A full turn is 360 degrees. A turtle could turn right 10 degrees 36 times, or left 5 degrees 72 times, or any other numbers make 360!

Challenge: Dashed lines

Can you use a loop to make the track lines dashed instead of solid?

Hint: Find the code that draws a straight line. Try using: `for`, `forward()`, `penup()` and `pendown()`
